Being a Blood Donor

Note: The following article is adapted from a newspaper column entitled “Dr. Paul Donohue”.

Pre-reading

Questions:

• What do you know about being a blood donor?
• Have you ever donated blood?

Definitions:

• Promote – to help the growth of something
• ml – abbreviation for milliliter – a unit of measurement equal to one-thousandth of a liter
• Eligible – able to do something; qualified for something

Reading

Dear Dr. Donohue:

I give blood regularly and have done so for years. Does it promote good health by making the body replace blood cells that have been taken? Or is the loss of blood hard on your health?

Answer:

I have nothing but praise for you. I wish everyone were as generous as you. Nine out of ten of us will need blood some time in our lives. In the United States, more than 40,000 units of blood are used daily. A unit is a pint, about 500 ml (milliliters). The average adult has between eight and twelve pints of blood. Most adults can easily spare one. Only 5 percent of people eligible to give blood do so. You fulfill a great need. Thank you.

Giving blood doesn’t make a person healthier. It doesn’t make a person unhealthier, either. If a person’s health would be negatively affected by donating blood, the nurses drawing blood would not allow a donation.

Here are few more facts to know about being a blood donor. Donors must be at least 17 years old and weigh at least 110 pounds. Donors must show an official form of identification. It must show proof of your age, your signature, and/or your photo. People can donate blood every 56 days. The blood count returns to normal in three or four weeks. After the blood donation the donor can exercise normally. However, he or she should avoid heavy lifting or pushing.
